

## **TUBULAR VISION:**

Loss of sight at the outer edges of the visual field. Patients may usually notice this while driving when they are unable to see an overtaking vehicle till it is beside or ahead of them. If glaucoma is left untreated, the field of vision continues to shrink until a tubular vision is left (as if a person is seeing through a long tube). Gradually if left untreated then this tube gets smaller and smaller till at last the person becomes blind.

### **Can this blindness be cured?**

In this case prevention is the only cure. The vision loss due to chronic glaucoma is irreversible. It is important to detect glaucoma before significant vision loss occurs and this can be done by some routine tests done by an ophthalmologist.

### **Is No injection glaucoma surgery possible!**

**Yes. Glaucoma surgery is possible without any kind of injection.**
