The machine design assistance section aims to facilitate a platform for expert advice and solutions on real time design problems and encourage design improvement, evaluation, analysis and adoption amongst MSMEs.

About Us

The machine design assistance section aims to facilitate a platform for expert advice and solutions on real time design problems and encourage design improvement, evaluation, analysis and adoption amongst MSMEs. The machine tool industry has seen a shortage of industry ready and experienced designers who can support a creative, application oriented and innovative approach to the final products and to the processes of drawing and manufacturing. It aims to encourage SMEs to move forward from reverse engineering to developing their own designs and consequent brand building in the national and international markets. The current UNIDO-ICAMT intervention for technology up-gradation and productivity enhancement of target manufacturing industries in India, aims to fill this gap in machine design awareness, innovation and implementation to improve the competitive position and enhance productivity. A holistic approach addressing issues across not only Machines but also Accessories, Sub Systems, Tooling, and Components is conceived.
